VPN Troubleshooting Guide

Overview: The Virtual Private Network (VPN) provides secure access to the corporate network from remote locations. Follow these steps if you are unable to connect.

1) **Verify Internet Connection:** Ensure you are connected to the internet before launching the VPN client. Open a web browser and load a public website.
2) **Check Credentials and MFA:** Verify that your corporate password is correct and that you have your mobile device ready to approve the Multi-Factor Authentication (MFA) prompt.
3) **Switch Gateways:** If the default VPN server is unresponsive, select an alternate geographic region or gateway from the dropdown menu in your VPN client.
4) **Restart the Client and Device:** Completely quit the VPN application (check the system tray or menu bar) and relaunch it. If the issue persists, reboot your computer.
5) **Check for Conflicting Software:** Ensure no personal firewalls, third-party antivirus, or other VPN clients are running simultaneously and blocking the connection.
6) **Escalation:** If you receive a specific error code (e.g., "Certificate Revoked" or "Account Locked"), take a screenshot and contact the IT Helpdesk.
